Dell EMC Networking Layer 3 Leaf-Spine Deployment and Best Practices with OS10. Published March 2018. Due to increasing east-west traffic within the data center (server-server, server-storage, etc.), an alternative to the traditional access-aggregation-core network model is becoming more widely used. This architecture is known as a leaf-spine network and is a non-blocking network where all devices are exactly the same number of hops away.

spine is expected to robust and non-blocking. Each leaf switch has a Layer 3 (point-to-point) link to each spine; thus the name Layer 3 Leaf and Spine (L3LS). The real value in a Layer 3 Leaf and Spine topology allows customers and service providers alike to design, build and deploy highly scalable, stable and resilient data center networks.

The FabricPath spine-and-leaf network is proprietary to Cisco, but it is mature technology and has been widely deployed. It provides a simple, flexible, and stable network, with good scalability and fast convergence characteristics, and it can use multiple parallel paths at Layer 2.

Cisco Data Center Spine-and-Leaf Architecture: Design ...

Leaf-spine network architecture is catching up with large data center/cloud networks due to its scalability, reliability, and better performance. As shown below, the leaf-spine design only consists of two layers: the leaf layer and the spine layer. The spine layer is made up of switches that perform routing, working as the backbone of the network.

Herniated disk: 6 safe exercises and what to avoid

Leaf-spine allows for interconnections to be spread across a large number of spine switches, obviating the need for massive chassis switches in some leaf-spine designs. While chassis switches can be used in the spine layer, many organizations are finding a cost savings in deploying fixed-switch spines.

A spine-and-leaf topology would need to be planned into the Cisco Nexus 9000 Series design. A spine node is a node that connects to other switches in the fabric, and a leaf node is a node that connects to servers (Figure 2). The current Cisco Nexus portfolio remains the same, focusing on the Cisco Nexus 7000, 6000, and 5000 Series chassis.
