### **IJME - Making sense of Cronbach's alpha**

A statistic commonly used to measure internal consistency is Cronbach's alpha ( $\alpha$ ). Cronbach's  $\alpha$  can range from 0.0 to 1.0, and it quantifies the degree to which items on an instrument are correlated

### **Reliability: Measuring Internal Consistency Using Cronbach's $\alpha$**

Cronbach's alpha coefficient was examined to determine the internal consistency of the scale which indicates how well the items fit together conceptually [23, 24], with the acceptable value of  $\geq 0.70$ . If an instrument contains two or more subscales, Cronbach's alpha should be computed for each subscale as well as the entire scale [23, 24 ...

### **Development of the competency scale for primary care ...**

Cronbach's alpha gives us a simple way to measure whether or not a score is reliable. It is used under the assumption that you have multiple items measuring the same underlying construct: so, for the Happiness Survey, you might have five questions all asking different things, but when combined, could be said to measure overall happiness.

### **Cronbach's Alpha - Statistics Solutions**

including Cronbach's alpha, Spearman's rank correlation, and R<sup>2</sup> coefficient determinants. All these indexes have been used because no single tool has been considered precise enough. Cronbach's alpha was created to measure the internal consistency of the exams [ 2-4]. Although it is considered a good index for station stability, it has
