Sequencing Batch Reactors DESCRIPTION The sequencing batch reactor (SBR) is a fill-and-draw activated sludge system for wastewater treatment. In this system, wastewater is added to a single "batch" reactor, treated to remove undesirable components, and then discharged. Equalization, aeration, and clarification can all be achieved using a single batch reactor. To optimize

Sequencing Batch Reactor (SBR)... If sufficient hydraulic retention time (HRT) is provided to permit nitrification during the "react" phase of the SBR cycle and if the fill stage is anoxic for a sufficient HRT, the system can remove significant amounts of nitrogen and phosphorus.

Sequencing Batch Reactors

The sequencing batch reactor process (SBR) involves a single complete mix type reactor in which aeration takes place followed by clarification, whence the designation "sequential". Sludge settles when aeration is shut down and a drainage mechanism used to draw off the supernatant liquor.

Sequencing Batch Reactor Design Guideline

Sequencing batch reactors (SBR) or sequential batch reactors are industrial processing tanks for the treatment of wastewater. SBR reactors treat waste water such as sewage or output from anaerobic digesters or mechanical biological treatment facilities in batches. Oxygen is bubbled through the waste water to reduce biochemical oxygen demand (BOD) and chemical oxygen demand

Sequencing batch reactor - Wikipedia

Sequencing batch reactor (SBR) is a wastewater treatment system based on activated sludge operated on a sequence of fill and draw cycles. SBR treatment for wastewater produces an effluent that is better than that obtained by a secondary treatment and can operate over a wide range of hydraulic and organic flow variations (Mace and Mata-Alvarez, 2002).
